

Abstract

The invention relates to a method for the simplified testing of browser-adapting server applications, wherein key information is evaluated in order to adapt the browser-adapting server applications, said information being taken into account either directly or indirectly by an information-extracting browser. The inventive method is characterized in that the key information which is recorded by means of various other server applications of a large number of various browser types and versions is taken into account in order to check information adaptation methods therewith.
